Slide 1:
Good afternoon, teachers. I am Dheeraj. My Personal code is 003071-0, and today, I would like to present to you about the theme of my presentation, which is reducing or continuing meat consumption. I chose this theme because there has been an ongoing debate about it, which is one of the root causes of the Amazon rainforest fires last year.

Slide 2:
This is the outline of my presentation. This is the connection between my RLS and my KQ. There are different stakeholders in the issue and their actions are different. They justified why their actions are right due to their different views and perspectives. I wonder whose actions are right or wrong and made me question the basis of their actions.

Slide 3:
My real-life situation is an article from Business Insider, which depicts the perspectives of the different stakeholders on meat consumption being the root cause of the Amazon rainforest fires in August 2019. The stakeholders explored are the farmers, the Brazillian president, the G7 countries, the consumers and the Brazillian indigenous tribes.

Slides 4 and 5:
Now, let me analyse the roles of the different stakeholders in the article. I am using the theories of the ethics as my perspectives to investigate and analyse the different stakeholders.

First are the farmers, who rely on the slash-and-burn method to pasture land, where 50% of the Brazillian livestock was raised and agriculture was grown. It is not fair in terms of results and outcomes.

As for consumers, as the saying from “The stone reader” goes, “Yet our relentless efforts to increase individual wealth and prosperity are already causing massive, precipitate changes in the natural world.” High demands for beef consumption by consumers, especially in China(the world’s largest consumer of Brazillian beef), have resulted in the need for more Brazillian commodities, and land to be cleared in the Amazon rainforest, so as to rear more livestock.

The damage done is so much that it is too late to put in back in place. The consumers and farmers share something in common and that is they believe that they are not responsible for what is happening to the environment and the animals living in the forest. One of our duties as consumers is to safeguard animals and we should control or reduce the meat consumption instead of satisfying our taste buds.

Next are the G7 countries, who have pledged 20 million USD to aid Brazil in combating forest fires and the bloc continues to help others when in need. The bloc helps by protecting

the environment, even if that means harming the relationship with Brazil. The G7 countries are taking necessary actions which is the right thing to do and they are not worried regardless the outcome which has positive or negative impact. As one of the oldest existing rainforests in the world, G7 countries see it as their utmost important duty to protect and safeguard it.

Slides 6 and 7:
From the real-life situation and the five stakeholders, I can understand that there are two areas of knowledge involved- ethics and the indigenous knowledge systems. In the area of ethics, I will explain the concepts of the Deontological and Consequentialist perspectives, along with utilitarianism and virtue ethics. In the area of the indigenous knowledge systems, I will be mentioning about the Mura tribes, a prominent indigenous group in the Amazon rainforest.

Slide 8:
And these therefore lead to our knowledge question, “On what basis do we decide what is right or wrong?”

Slide 9:
Before I go deeper into

Slide 10 :

1. Deontological theories: It is the measure of whether an action is right or wrong by considering the nature of the action itself, the motivation or the intention behind it, and this might seem like a fair and reasonable measure of ethical actions.

Slide 11:

Stakeholder affected by Deontological theories	Details
G7 Countries	Pledged US$20 million to aid Brazil in combating forest fires The bloc continues to help others when in need To protect the environment, even if that means harming the relationship with Brazil.

Farmers	Slash-and-burn methods to create pasture land. This could be used for their living-income and food.
Brazilian government	It is their duty to protect the environment and their people so that they are affected but the government did not take much action. Mr Jair Bolsonaro plays down the statistics of Amazon forest fires and blames the NGOs for exaggerating about the Amazon forest fires. He is prioritising economy over environment.

Slide 12:

1. Consequentialist theories: It is the measure of whether an action is right or wrong on the basis of the result, outcome or consequences of the action.
2. Utilitarianism - is the most the more good outcomes or good consequences, the better the action . Focused on number.
3. Act consequentialism - A particular action is morally good only if it produces more overall good than any alternative action.
4. **Hedonism** states that people should maximise human pleasure.
5. Negative consequentialism - A person should choose the act that does the least amount of harm to the greatest number of people.

Slide 13:

Stakeholder affected by consequentialist theories	Details

G7 Countries	Pledged US$20 million to aid Brazil in combating forest fires. Amazon fires caused huge air pollution which had outreach till India. To ensure people's welfare, Heads of G7 states contributed money. Amazon fires, logging and mining activities are destroying the Amazon forest. After 2015 Paris Climate change summit, Many countries including G7 countries are working towards mitigating climate change. French president emphasised the importance of saving the Amazon fires.
Consumers	The demand for Brazilian meat and commodities, especially by Chinese consumers, would be able to satisfy their cravings and needs for the products, even if this means greater deforestation back in the Amazon. Brazilian meat such as beef and pork are a staple for chinese consumers
Indigenous tribes	Mura tribe: Lives of the future generation will be affected. Their tribes' existence and welfare is very important to them. It is threatened by the forest fires. They want to protect the forest and maximise the welfare of their people. The forest provides them shelter and food for them.

Slide 14:

Stakeholder	Questions relating to Consequentialist theories	Theories of consequentialist ethics

G7 Countries	• Why do the G7 countries pledge a huge sum of money to Brazil? • What are the possible benefits that the G7 countries are going to get from their donations?	Utilitarianism Act consequentialism
Consumers	• Why is there increase in demand for Brazilian beef? • Why is China consuming beef from Brazil, the second largest producer?	Hedonism
Indigenous tribes	• What makes the Mura tribe decide on what consequences arise? • How do they come to the conclusion of the outcomes?	Negative consequentialism

Consequentailism negative points

1. **Impractical for real life use**
2. **Bad for society**
3. **Less flexible**
4. **Future consequences are difficult to predict**
5. **Measuring and comparing the 'goodness' of consequences is very difficult**
6. **It is easy to bias in favour of particular groups**
7. **It ignores things we regard as ethically relevant**
8. **It doesn't take account of the 'fairness' of the result**
9. **It can be inconsistent with human rights**

Slide 15:

1. Virtue Ethics: It is easy to put on paper what deontological and consequential ethically minded people would do. However for people who are virtue ethically

minded, it differs greatly for each individual. Virtue ethics is primarily concerned with traits of character that are essential to human flourishing, not with the enumeration of duties.Actions of the individual defines what kind of character he wants to be

Slide 16:

Stakeholder affected by virtue ethics	Details
The brazilian president Jair Bolsonaro	● He blames NGOs for exaggerating the situation of the Amazon forest fires ● He has also deployed several troops to combat the forest fires He is supports the forest fires as he believes that there is a need for infrastructure and more jobs need to be provided for the people. The economy will grow and benefit the people. But not everyone benefits as the mura tribes are affected. Mr Jair believes he is doing the right thing and has made a moral decision based on his virtues and wisdom.

Slide 17:

Slide 18:

Slide 19:

Stakeholder	Details from the RLS	Possible questions	Relevant concepts
Mura tribes	● Saddened by the disappearance of the forests due to the infrastructural development ● Worried about the lives of the future generation not being able to live in the forest. ● Complain about the long distances needed to obtain the tribe's food as they are no longer available in the forest	1. How does the Mura tribe develop their emotions towards a particular event? 2. How will the future generation of the Mura tribe not be able to live in the forest? 3. What sort of measures will help the Mura tribe to be preserved in the Amazon?	Indigenous tribes

Slide 20 :

Conclusion

Knowledge can be interpreted by various stakeholders differently.

In the RLS:
Different stakeholders view each other actions as either right or wrong. They have different moral values and perspectives. These are governed by their own ethical principles that they uphold. Their upbring and environment also affects the decision that they make. For example the mura tribe. They were brought up in a different environment and have different traditions and customs, thus, their approach to the issue is different to the other stakeholders.
One's background, moral values and immediate stance on the issue affects the decision that they make which might be right or wrong.

Strengths of our conclusion:
Multiple stakeholders discussed

Potential flaws of our conclusion:
The KQ involves a myriad of other perspectives that were not included in the discussion because they had limited information

Slide 22:

Nike Sweatshop scandal

Nike, a company which has prided itself on work ethics, has been criticised by activists in neglecting the safety and well-being of its workers, especially in developing countries such as Bangladesh, India, Cambodia and Thailand. This included providing extremely low wages to workers, and restricting them access to clean water and toilet usage.

Examples:

1996: A twelve year old Pakistani boy was sewing a Nike soccer ball

2018: Clean Clothes Campaign reported that Nike still pays "poverty" wages to its workers

There are different stakeholders in this company.

1. Shareholders
2. Workers
3. Company leaders and the company itself

4. The activists and NGOs
5. consumers
